Thank you for applying to a technical position at MannLab and/or Steve Mann's UofT HI lab.

At MannLab, we build ethical technology to positively invent and shape the future of humanity. This requires well developed technical skills. We are a multidisciplinary team with some broad hackers who can excel in many areas, and some makers who are more specialized and deep in one or two areas.

Intelligence and talent are prerequisites to excelling in the lab, but they are only the raw ingredients for engineering skills. What we need to see is how you have utilized these raw ingredients to develop real-world, applied, technical skills. Show us the area or areas in which you have developed your abilities, which can only be done by building projects, making things that work, and moving from an initial mental vision to a working prototype.

Thus, we want you to demonstrate your skills by showing off things that you have made.

Deliverable (what you should respond to this email/phone-call/message with):

Show us 3 personal (*not* school) projects in the form of video demonstration, code, pictures, documentation, links, etc. Show us what the project is and how *you* built it. Use this to show off *your* skills with tangible examples.
